

## **M CLEAN: NEW SOLVENT-FREE CLEANING AGENT**

### **What is M Clean?**

**M Clean** is an aqueous, solvent-free, non- polluting and non toxic cleaning agent for your tools.

**M Clean** is an alternative to acetone which offers improved efficiency and a longer life span for the following two main reasons:

- The resin particles separate naturally from the cleaning agent
- The evaporation rate is 3 times lower than that of the acetone

### **What are the main advantages over solvent?**

- **M Clean** does not generate VOC emissions in the workshop: It is no longer necessary to use an extraction system. Operators are protected from skin irritation and respiratory problems and the company will not have to pay taxes on VOC emissions due to acetone.
- **M Clean** eliminates all risks of fire and explosion in your workshop.
- It is diluted form; **M Clean** has a neutral pH on skin. It does not represent a danger to operators or the environment and it improves operator safety.
- **M Clean** is sold at a competitive price with regards to acetone, with a life span that is 50% higher for a fast Return on Investment of the cleaning station.

### **How to use M Clean?**

To reduce shipping costs and storage space, **M Clean** is supplied in its concentrated form.

1 L of concentrated M Clean allows to obtain 21 L of cleaning mixture. Thus, with a 200L drum you can make 4 200° L of cleaning mixture.

To be effective, M Clean needs to be mixed with hot water in a cleaning station (available capacities: 50 L or 150 L) which is equipped with a temperature regulation system.

When cleaning your rollers, the resin separates from the cleaning agent and sinks to the bottom of the cleaning station. All solid residues gather together and can then be removed easily.

The cleaning station is secured and remains ready to be used at all times since the cleaning agent does not evaporate and remains active for a long period of time.
